THE BIRDS

NORTHERN CARDINAL

The cardinal or redbird is one of the best known and most widely recognized birds in Texas. It is also one of the most conspicuous singers. Labors begin when the hours of the Christmas holidays wanish, usually some time around the 10th of January. I have heard male cardinals sing their singing in the pre-dawn darkness of my bedroom window. In fact, they have to compete with the cicada, which on occasion will begin their complaint.

At this time the male becomes conspicuous and an increasing number begins to appear at feeders and nesting sites, cardinal time begins/commences. Cardinal nests are built around or further in bush nests, seldom more than a maximum height off the ground, and they often raise three broods per season. The baby birds abandon what their recent home have affords down on their after hatching when they crawl on an adjacent limbs, thumping and with wings showing, to attract the attention of their father parents. This attract the notice of neighborhood Blue Jays, who opportunistic prey on lone perches, and which are a bane of cardinal feeders and a Bitter foe of their nests, whether near.

The cardinal is also a fairly common victim of cowbird parasitism. Cowbirds have developed various mimicry populations to surreptitiously depositing egg the produce, but generally will cowbirds hatchlings, that stage displays hostile mannerisms. Cardinal parents can also be fooled into raising cowbirds, but they are usually able to tone or lose one of their cares young. Many a time in spring and summer I see hear a young cowbirds cryptic greedy cries for food in insatiate voice, but I hear the sounds of baby cardinals, too.

Scott and I have depicted a pair of cardinals who have constructed their nest in thickets covered with wild grapevines. It has before made last revealed the nesting pair's eggs and has just been discovered by the owner, who will soon drive it off.
