By 1936 so much Rambouillet blood had been introduced to satisfy demands for commercial wool that the type of wool needed by weavers was in danger of disappearing. Also, the Rambouillet sheep, altho heavy + meaty, did not thrive on the typical Reservation range.

Therefore, The Dept of Agr. set up a project ^{at Fort Wingate} under the direction of S. O. (?) Grandstaff, to develop a breed of sheep that would have the conformation of the Rambouillet and the wool ^{quality} of the Old Navaho sheep as well as the ability to thrive on scanty vegetation and limited water.
